## 1.0 INTRODUCTION AND CONCLUSIONS

### 1.1 Background to this Study

Restwell Trailer Park is proposed to be redeveloped (**Figure 1**) from a trailer park into a comprehensive residential and resort community to be known as the Spring Creek Mountain Village. This site is located within the Town of Canmore, covers approximately 65.5 acres of land, is within walking distance of downtown and is bounded to the east by CPR tracks and to the west by Spring Creek. The site currently accesses the adjacent road network via 5 Avenue at Main Street.

The current site operates as a lease and mobile home community with approximately 220 mobile homes and 250 recreational vehicle sites. The site also contains two permanent residential homes and various ancillary buildings. When full, the population of the site can exceed 1,000 residents including both permanent and vacation residents.

The developer proposes a staged development of the site to include both residential and commercial properties. Spring Creek Mountain Village would consist of about 7 single family homes, 605 apartment units, 210 townhome units and 225 senior apartment units. These residential properties are envisioned to consist of 60% permanent-use and 40% non-permanent use. The commercial component will consist of three hotels with 580 rooms in total and about 40,000 ft<sup>2</sup> of other boutique type commercial properties (artist studios, specialty stores ...etc.).

A new access is proposed for the site that will connect directly to Bow Valley Trail opposite Montane Road. The purpose of the new access is to accommodate increased traffic from the proposed development and provide emergency access for the development across the railway. The existing traffic volumes at the intersection of 5 Avenue/Main Street intersection (existing Restwell Trailer Park site access) after the full re-development of the site are not expected to exceed 3,000 vehicles per day. Instead, the additional traffic from the site will be directed to the new access at Bow Valley Trail/Montane Road. This study will outline the trips generated by the proposed development and how these trips are distributed to the two accesses for the Spring Creek Development.

The goal for portions of this proposed development is to develop properties where residents may live and work. The intent is to construct these residential units with the living space immediately above the street-level workspace. The retail component will cater to the tourist traffic from the hotels and to the local residents on the site. The development by its close proximity to downtown will offer residents other attractive modal options, apart from the car, such as walking or biking.

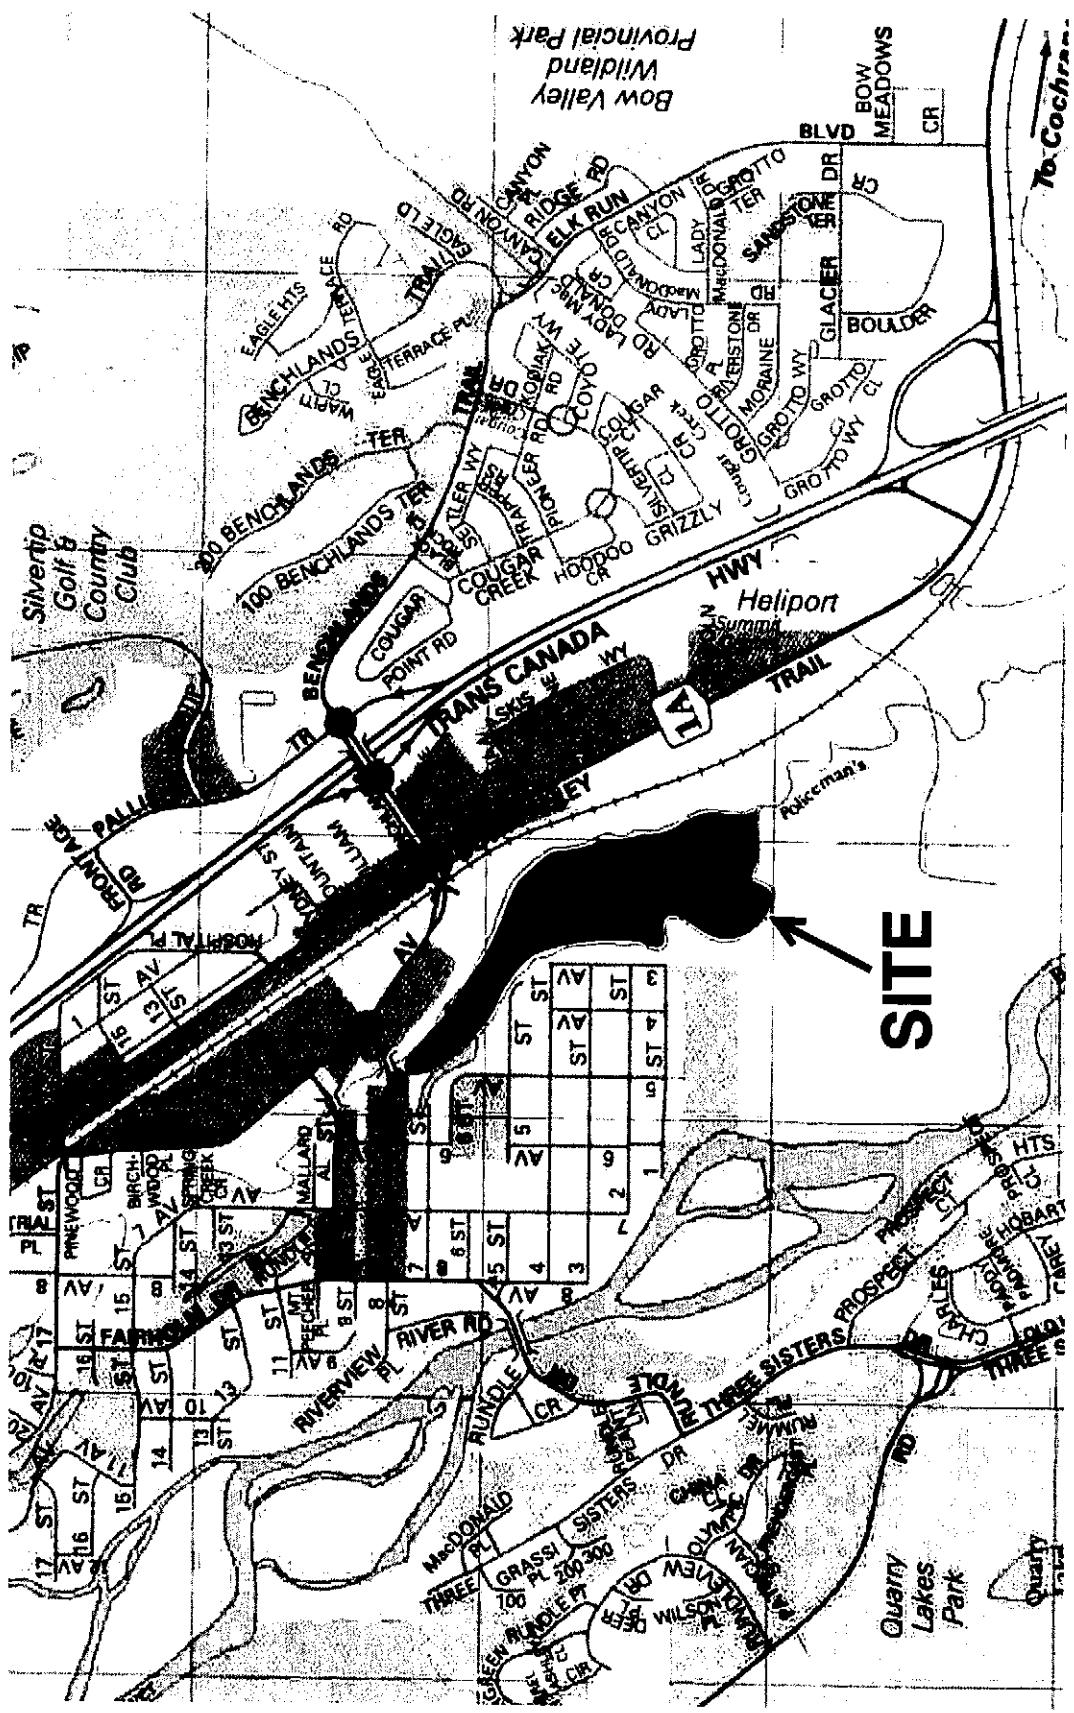

## Figure

## SITE LOCATION

File# 5688.02, September 2003

The developer retained Finn Transportation Consultants to examine the future traffic impact on the area road system resulting from the full build-out of Spring Creek Mountain Village. Build-out of the site is expected to take between 15 and 20 years. This timeframe coincides roughly with the build-out of the Town, which is expected to reach the 30,000 population within 10 to 20 years. Therefore, this transportation study will examine the effect of the proposed development, at full-build-out, on the surrounding road network in the immediate vicinity of the site for the weekday morning, afternoon and Saturday peak hours. This study also examines the internal road network and ensures that the internal road system can accommodate the site traffic generated.

## 1.2 Study Area

The study area examined for the proposed development includes the two site access locations (existing and proposed) as well as the three additional intersections as follows:

- Main Street/6 Avenue
- Main Street/5 Avenue (existing site access)
- Main Street/Railway Avenue
- Bow Valley Trail/Benchlands Trail
- Bow Valley Trail/Montane Road (proposed site access)

## 1.3 Conclusions

The following are FINN's primary conclusions drawn from this study:

- The existing Restwell Trailer Park site generates approximately 2,500 vpd. The existing road network and surrounding intersections typically experience little to no congestion or level-of-service problems due to the existing development on the Restwell site.
- The future background traffic volumes match those presented in the latest Town of Canmore Transportation Study for the ultimate build-out of the Town of Canmore less than traffic generated by the existing Restwell Trailer Park site. In completing our future analyses we assumed that Railway Avenue, Bow Valley Trail and Benchlands Trail were widened to four-lane roadways with separate left-turn lanes at key intersections. With these upgrades, the intersections within the study area function at acceptable Levels-of-Service (LoS) for the weekday morning, afternoon and Saturday peak hours with the following exceptions. The **Main Street/Railway Avenue** intersection exhibited several movements

that were close to capacity and a single movement (the eastbound left-turn) which is expected to operate with a calculated volume-to-capacity ratio (V/C) of greater than 0.9 during the p.m. peak hour. In other words, the volume of traffic making the eastbound left turn is expected to be greater than 90% of the physical capacity of the turning lane. The intersection of **Bow Valley Trail/Montane Road** has side-street movements in the weekday p.m. and Saturday peak hour that experience long delays and results in an overall failing LoS for this intersection.

- At full build-out of the development we estimate that the Spring Creek Mountain Village site will generate approximately 9,250 vpd. As indicated in Section 1.1, Spring Creek Mountain Village site will access the area road network at two locations. The 5 Avenue access is projected to carry of the order of 2,970 vpd while the Bow Valley Trail access is estimated to carry about 6,270 vpd.
- The future post-development traffic volumes were calculated by adding the site generated volumes from the full build-out of the Spring Creek Mountain Village to the future background traffic volumes. The same road network as was analysed in the future background scenario was used except that the Bow Valley Trail/Montane Road intersection was assumed to be signalized. Based on our review of the weekday morning, afternoon and Saturday peak hours, we note the following:
  - The **Main Street/Railway Avenue** intersection had four movements with V/Cs greater than 0.9 for the weekday p.m. peak hour. It should be noted that the Spring Creek Mountain Village traffic is less than 5% of the traffic for three of these critical movements and 14% of the eastbound left-turn traffic. Therefore, the majority of the capacity for these movements is utilized by future background traffic.
  - The **Main Street/5 Avenue** intersection was analysed as unsignalized. The northbound left-turn experienced long delays during the weekday p.m. peak hour. It was recommended that the traffic signals along Main Street be co-ordinated to provide more gaps between eastbound/westbound traffic platoons and thereby increasing the turning opportunities for the northbound left-turn movement.

\* \* \* \* \*

Subsequent to our analysis, the developer has provided us updated information in regards to staging and residential unit numbers for the Spring Creek Mountain Village site. These numbers are as follows and are shown in **Table 1**:

**TABLE 1. SPRING CREEK MOUNTAIN VILLAGE DEVELOPMENT BY STAGE**

	STAGE 1 (2005-2010)	STAGE 2 (2010-2015)	STAGE 3 (2015-2020)	STAGE 4 (2020-2025)	TOTAL
<b>LAND AREA</b>					
Area Hectares	14.4	2.2	4.9	7.0	28.5
Area Acres	35.6	5.4	12.1	17.3	70.4
<b>RESIDENTIAL</b>					
Mature Adult/Seniors Apartments	63	58	75	58	254
Other Apartments	102	58	179	309	648
Residential Townhomes	14	33	30	64	141
Residential Single Detached	7	0	0	0	7
Total Residential Units	186	149	284	431	1,050
<b>COMMERCIAL</b>					
Hotel Rooms (anticipated)	200	0	350	0	550
Hotel Related Commercial (sq.ft.)	15,000		15,000		30,000
Other Street-front Commercial (sq.ft.)		3,500	3,000	3,500	10,000
Mobile Homes remaining (Existing = 220)	176	116	76	0	

**Note: Table provided by Mountain Engineering Ltd. October 23, 2003**

We compared the total trips generated based on the information provided in Table 1. The total trips generated based, on this information, result in 611 vph in the weekday a.m. peak hour, 825 vph in the weekday p.m. peak hour and 774 vph in the Saturday p.m. peak hour. The total weekday daily trips generated are 9100 vpd. This is approximately 2% less than the total daily trips generated from the stated development reviewed in this study. Therefore, even with these new numbers proposed in Table 1, the results of this study are still valid because the trips generated are almost identical.

Our study indicated the need for traffic signals at the intersection of Bow Valley Trail/Montane Road at the full-buildout of the site. However, the need for traffic signals at this intersection should be evaluated as development proceeds, on and off the Spring Creek Mountain Village site, and if signals are required then they should be installed prior to full-buildout.

## 2.0 EXISTING OPERATING CONDITIONS

### 2.1 Existing Road Network

The following roads comprise the main road network in the vicinity of the site:

- Main Street is a two-way, arterial standard road and is the main east-west road through the downtown. There are commercial properties on either side and on-street parking is provided. Sidewalks are provided on both sides of the street to encourage and protect pedestrian traffic.
- 6 Avenue is a collector standard road that leads into the residential area south of downtown Canmore and to residential and commercial to the north.
- Railway Avenue is an arterial standard road. This road serves commercial and residential development in Canmore. For this study, Railway Avenue is considered to have a north/south orientation.
- Bow Valley Trail, previously Highway 1A, is an arterial road that contains many hotels and restaurants. For this study, Bow Valley Trail is considered to have a north/south orientation.
- Benchlands Trail is an arterial-standard, divided roadway that connects to the residential subdivisions to the east of the Trans-Canada Highway.

The main intersections that were analysed were as follows. The traffic controls stated below are as exist currently:

- Main Street/6 Avenue (signalized)
- Main Street/5 Avenue (unsignalized – existing site access)
- Main Street/Railway Avenue (signalized)
- Bow Valley Trail/Benchlands Trail (signalized)
- Bow Valley Trail/Montane Road (unsignalized)

## **2.2 Existing Traffic Volumes**

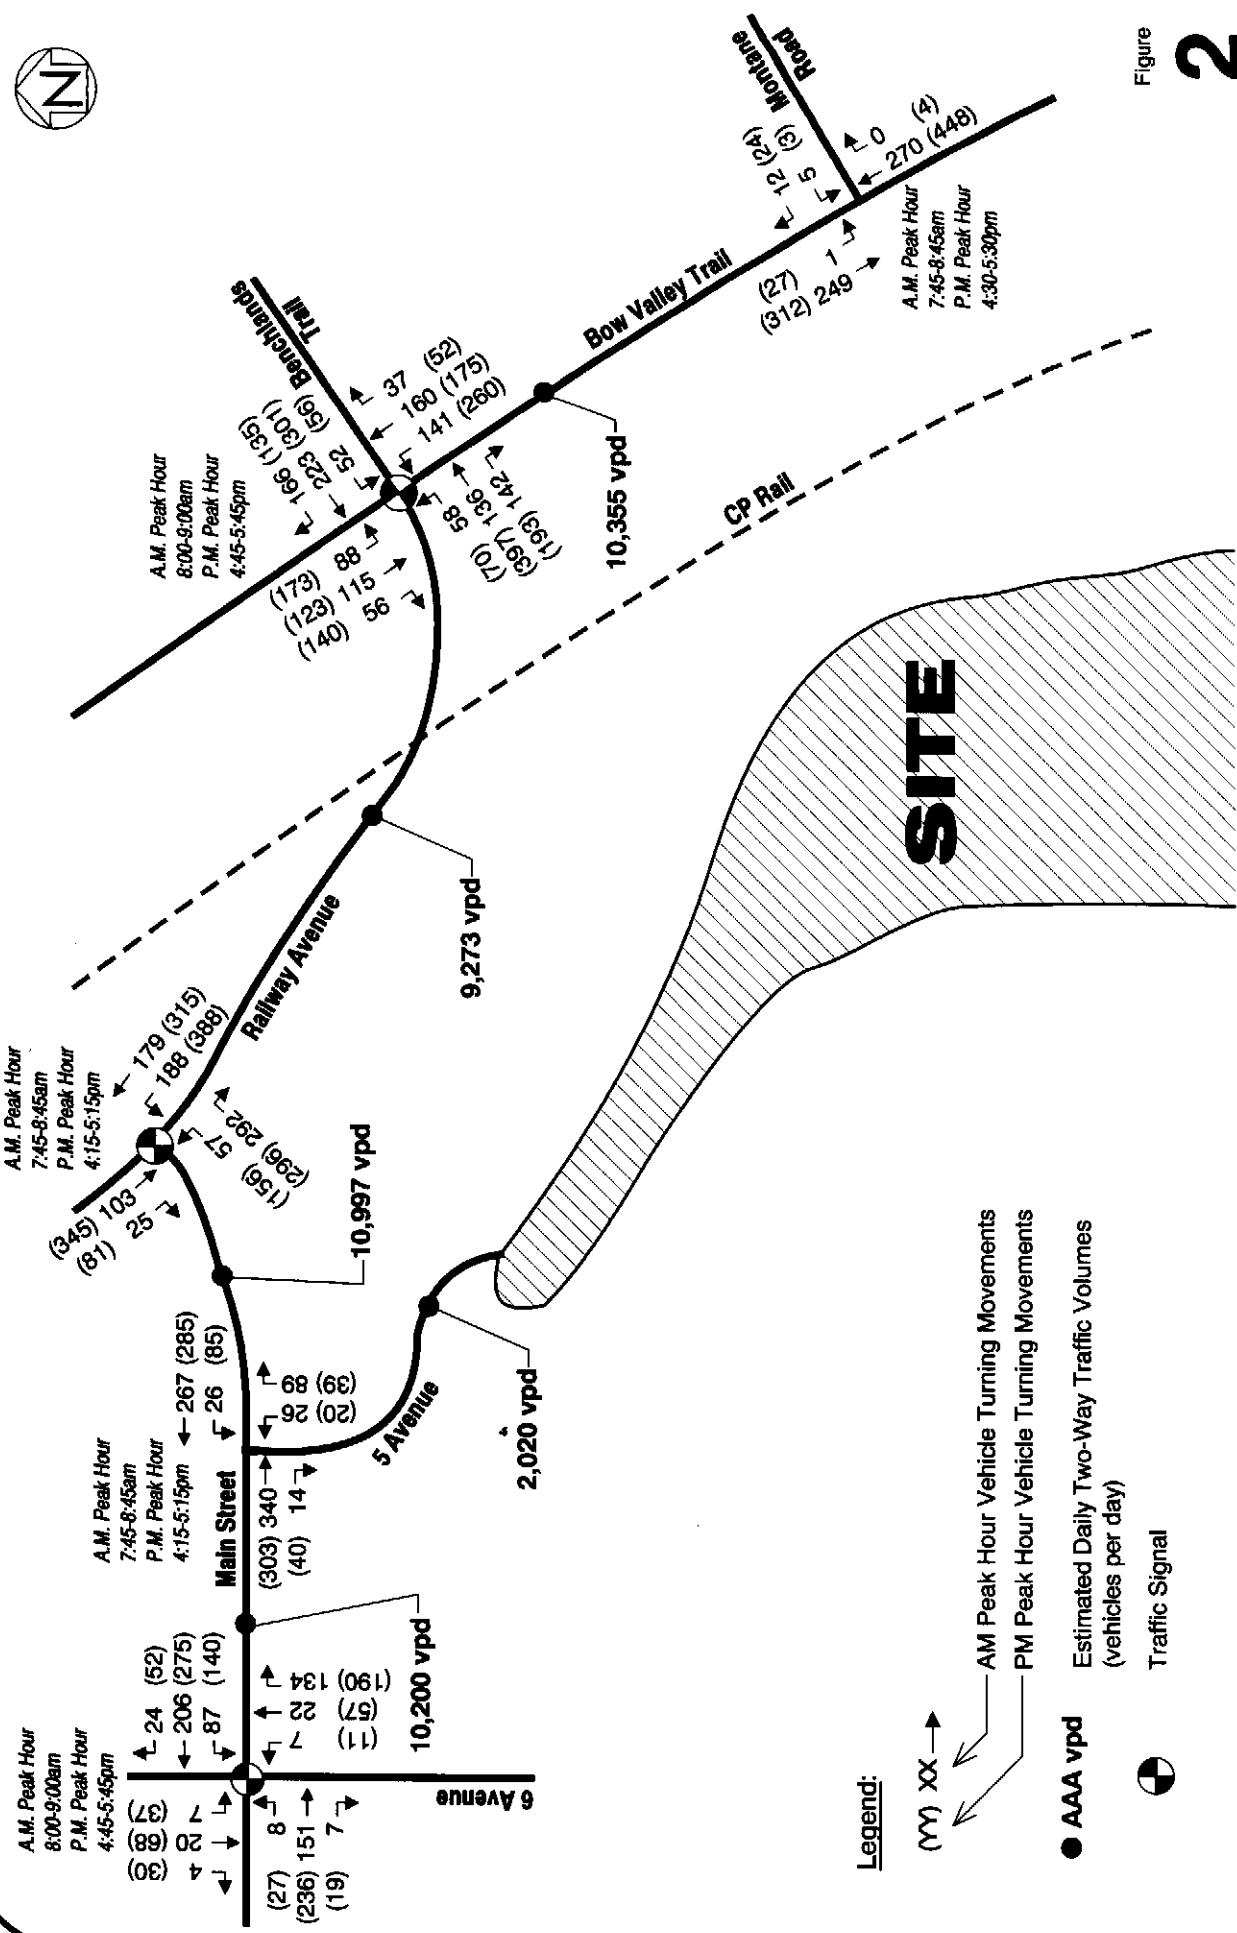

FINN conducted both turning movement counts and tube counts at the main study intersections and the adjacent roadway sections. Most of the data was collected in August 2002 and supplemental turning movement data was collected in August 2003. The existing data collected included data for the weekday a.m. peak hour, weekday p.m. peak hour and typical Saturday peak hour. These counts are summarized in **Figures 2 and 3**.

## 2.3 Intersection Performance

We evaluated the existing operating conditions using the Synchro/SimTraffic v.5 software package (based on the Highway Capacity Manual)<sup>1</sup>.

For unsignalized intersections, the methodology considers the intersection geometry, the traffic volumes, the posted speed limit and the type of intersection control. The average delay for each individual movement from the minor street, the major street left-turn movements and the overall intersection are calculated. An operational Level-of-Service (LoS) is then assigned based on the calculated average delay. LoS A and B represent good operational conditions with average delays of less than 15 seconds per vehicle. LoS C and D represent fair operating conditions, with average delays of between 15 and 35 seconds per vehicle. LoS E represents poor operating conditions, with average delays of between 35 and 50 seconds per vehicle. LoS F represents very poor operating conditions, or failure, with average delays in excess of 50 seconds per vehicle. Generally, geometric improvements or signalisation are recommended at unsignalized intersections, which experience LoS F.

For signalized intersections, the methodology considers the intersection geometry, the traffic volumes, the posted speed limit, the traffic signal phasing/timing plan as well as pedestrian volumes. The average delay for each lane group and the overall intersection are calculated. An operational LoS is then assigned based on the calculated average delay. LoS A and B represent good operational conditions with average delays of less than 20 seconds per vehicle. LoS C and D represent fair operating conditions with average delays of between 20 and 55 seconds per vehicle. LoS E represents poor operating conditions with average delays of between 55 and 80 seconds. Generally, geometric or phasing improvements are recommended at signalized intersections that experience LoS E or LoS F.

Another operational indicator for signalized intersections is the volume-to-capacity ratio (V/C). The V/C ratio compares the actual (or projected) demand to the capacity of a particular movement. A theoretical V/C ratio greater than or equal to 1.0 indicates that the approach is operating at or above capacity (i.e. greater-than-or-equal to 100%). For design purposes, most municipalities use a threshold of 0.9 (i.e. 90%) as a V/C ratio where improvements (phasing or geometric) are required.

---

<sup>1</sup> Transportation Research Board, Highway Capacity Manual, Washington, DC, 2000.

## 2.4 Existing Operating Conditions

We assessed the existing peak hour operating conditions at the five intersections within the study area and the results are summarized in **Table 2**. For these and all other analyses quoted in this report, the outputs are attached in **Appendix A**.

The intersections were assessed based on the existing lane arrangements. We analysed the intersections based on signal timing information provided by the Town of Canmore that we further optimised in Synchro. The existing analysis also includes the site traffic from the existing Restwell Trailer Park site. The results are summarized in **Table 2** below:

**TABLE 2. EXISTING OPERATING CONDITIONS**

INTERSECTION	PEAK HOUR	OVERALL INTERSECTION LoS	AVERAGE DELAY (secs/veh)	V/C RATIOS ABOVE 0.90 THRESHOLD
<b>Main St/6 Ave (signalized)</b>	AM	A	5	--
	PM	A	6	--
	SAT	A	6	--
<b>Main St/5 Ave (unsignalized)</b>	AM	A	2	n.a.

	SAT	A	2	n.a.
<b>Main St/Railway Ave (signalized)</b>	AM	A	6	--
	PM	B	12	--
	SAT	A	9	--
<b>Bow Valley Tr/Benchlands Tr (signalized)</b>	AM	B	17	--
	PM	C	22	--
	SAT	C	22	--
<b>Bow Valley Tr/Montane Rd (unsignalized)</b>	AM	A	<1	n.a.
	PM	A	<1	n.a.
	SAT	A	<1	n.a.

**Table 2** indicates that there are no capacity or delay issues at the study intersections. This analysis includes the traffic from the existing Restwell Trailer Park.

### **3.0 FUTURE BACKGROUND OPERATING CONDITIONS**

The Spring Creek Mountain Village site is proposed to develop in stages, over the next 15-20 years, after which time the site will be fully built. As such we have assessed the full build-out of the site. The Municipal Development Plan<sup>2</sup> and Transportation Plan<sup>3</sup> state that the Town expects the full-build-out of Canmore to occur when the population reaches 30,000. This is expected to occur within the next 10-20 years. Because the future build-out of the Town and Restwell Trailer Park site is to occur at approximately the same time, the future background traffic volumes represent the ultimate build-out scenario for the Town of Canmore.

#### **3.1 Future Road Network**

The future road network within the study area is expected to remain as it currently exists with the exception of some upgrading of the arterials to provide for four lane cross-sections on Bow Valley Trail, Railway Avenue and Benchlands Trail to accommodate the increase in traffic volumes.

The Spring Creek Mountain Village development will continue to access the area road system via 5 Avenue. However, the developer has committed to the fact that the 5 Avenue traffic volumes generated by the Spring Creek Mountain Village will remain mostly unchanged and not exceed 3,000 vpd. As such, the developer is proposing an alternate access to the east across the single Canadian Pacific Railway (CPR) track to Bow Valley Trail opposite Montane Road (**Figure 4**). CPR has indicated in discussions with the study team that based on their criteria, which is dependent on the number of trains per day at a crossing, the daily traffic volumes using the Bow Valley Trail access must remain at or below approximately 7,000 vpd. Daily traffic volumes in excess of this number will require an upgrade of the proposed at-grade railway crossing in order to safely accommodate the additional traffic.

#### **3.2 Future Background Traffic Volumes**

The future background turning movement volumes at the study intersections were not readily available from the Town of Canmore. Therefore, the future background turning movement and link volumes were obtained by factoring up the existing volumes to match the screenline volumes presented in the Transportation Study for the 30,000-population horizon.

Figure

4

## FUTURE ROAD NETWORK

File# 56983.02, September 2003

---

Specifically, we undertook the following in order to obtain future background traffic volumes:

- We obtained the forecasted daily, traffic volumes, along selected road sections from the 2001 Transportation Plan for the Town of Canmore. Table 2.2<sup>4</sup> presents both existing (2000) daily traffic volumes and forecasted daily traffic volumes at the 30,000-population horizon. These forecasted daily volumes reflect changes in transportation patterns due to increased use of transit and alternative forms of transportation and the resulting link traffic volumes were outlined in Table 2.3<sup>5</sup>. We calculated, the percentage growth along each road section by comparing the existing traffic volumes (Table 2.2) and the future adjusted traffic volumes (Table 2.3).
- We then related this future "link" growth to growth estimates for the turning movements at each intersection within the study area. In order to project the future turning movements we also reviewed historical turning movement data obtained from previous reports completed for the Town of Canmore<sup>6</sup> and other work FINN has completed in the Town of Canmore<sup>7</sup>. It was observed that some movements have grown more than others and are influenced by growth in different areas of Canmore. We also considered where future growth in the Town of Canmore would occur (e.g., Three Sister's Area) and where the Town has already been built-out. Therefore, all three factors - the link growth, observations made from historical data and recognition of future growth in the Town - were taken into consideration to estimate the future forecasted turning movement volumes.
- Lastly, we netted out the existing traffic volumes generated by the Restwell Trailer Park in order to ensure that we did not 'double count' any traffic in assessing the impact of the proposed Spring Creek Mountain Village.

The resulting future background traffic volumes for the weekday and Saturday peak periods are shown in **Figures 5 and 6**.

Elbow# 5888 112 September 2011

### 3.3 Future Background Operating Conditions

It was observed that there is a significant increase in the link volumes along the roadways from the existing situation. As well, the 2001 Transportation Plan for the Town of Canmore indicates that there will be associated road improvements along Railway Avenue, Bow Valley Trail and Benchlands Trail to accommodate future population growth<sup>8</sup>. Therefore, based on the future increase in volumes and comments from the 2001 Transportation Plan, the following road improvements were incorporated into the future background analysis:

- Railway Avenue was analysed as a four-lane cross-section with left turn bays at the major intersections.
- Benchlands Trail was analysed as a four lane arterial.
- Bow Valley Trail was analysed as a four-lane undivided arterial.

We assessed the future background peak hour operating conditions at the five intersections within the study area. The results are summarized in **Table 3**.

**TABLE 3. FUTURE BACKGROUND OPERATING CONDITIONS**

<sup>8</sup> Town of Canmore, Transportation Master Plan Final Report, September 2001, pp. 2-20 to 2-21.

The results summarized in **Table 3** indicate the following:

- **Main Street/6 Avenue** will operate with acceptable overall Levels-of-Service during the weekday a.m. and p.m. peak hour and Saturday peak hour.
- **Main Street/5 Avenue** will operate with acceptable overall Levels-of-Service with the site traffic netted-out from the background traffic volumes.
- **Main Street/Railway Avenue** will operate with acceptable overall Levels-of-Service during the weekday morning, afternoon and Saturday peak hours. However, the eastbound left-turn experiences capacity problems during the p.m. peak hour. It should be noted that the southbound through, northbound left-turn and northbound through movements are near capacity with V/C ratios of 0.86, 0.88 and 0.88 respectively.
- **Bow Valley Trail/Benchlands Trail** will operate with acceptable overall Levels-of-Service in the a.m. peak hours and Saturday peak hour.
- **Bow Valley Trail/Montane Road** will operate with acceptable overall Levels-of-Service for the weekday morning and failing LoS during the weekday afternoon and Saturday peak hours. The failing LoS is due to the westbound left-turn which will operate with delays in excess of 50 seconds/vehicle (LoS F) during the weekday p.m. and Saturday peak hours but this traffic constituted less than 2% of the total traffic entering the intersection. We conducted a traffic signal warrant analysis for this intersection using the methodology outlined in the Manual of Uniform Traffic Control Devices for Canada to determine if a signal is warranted (**Appendix B**). This warrant calculation accounts for collisions, crossing gaps, intersecting volumes and pedestrian volumes. A signal is warranted if 100 warrant points are calculated. From our analysis we calculated a traffic signal is not warranted (warrant points calculated less than 10). These warrant calculations do not include collision data because it is not available at this time for the future situation. Even without this data, the points calculated are still well below 100 points required to warrant a traffic signal. Therefore, this intersection does not require a traffic signal in the future background situation to address the side-street delay based on this analysis. The queue length for the westbound movement in the weekday p.m. peak hour is 3m and is 33m in the Saturday p.m. peak hour.

## 4.0 PROPOSED DEVELOPMENT

### 4.1 Proposed Development

The proposed development consists of 7 single family homes, 605 apartment units, 210 townhome units and 225 senior apartment units. The split between permanent and non-permanent accommodation will be 60/40. This split is based on a socio-economic study completed for the Spring Creek Mountain Village. The commercial component will consist of 3 hotels with 580 rooms in total, including an associated commercial component (i.e. restaurant...etc.) and 40,000 square feet of other boutique type commercial properties (artist studios, specialty stores). **Figure 7** outlines the land-uses associated with the proposed development. It should be noted that any non-permanent properties would be interspersed among the development area.

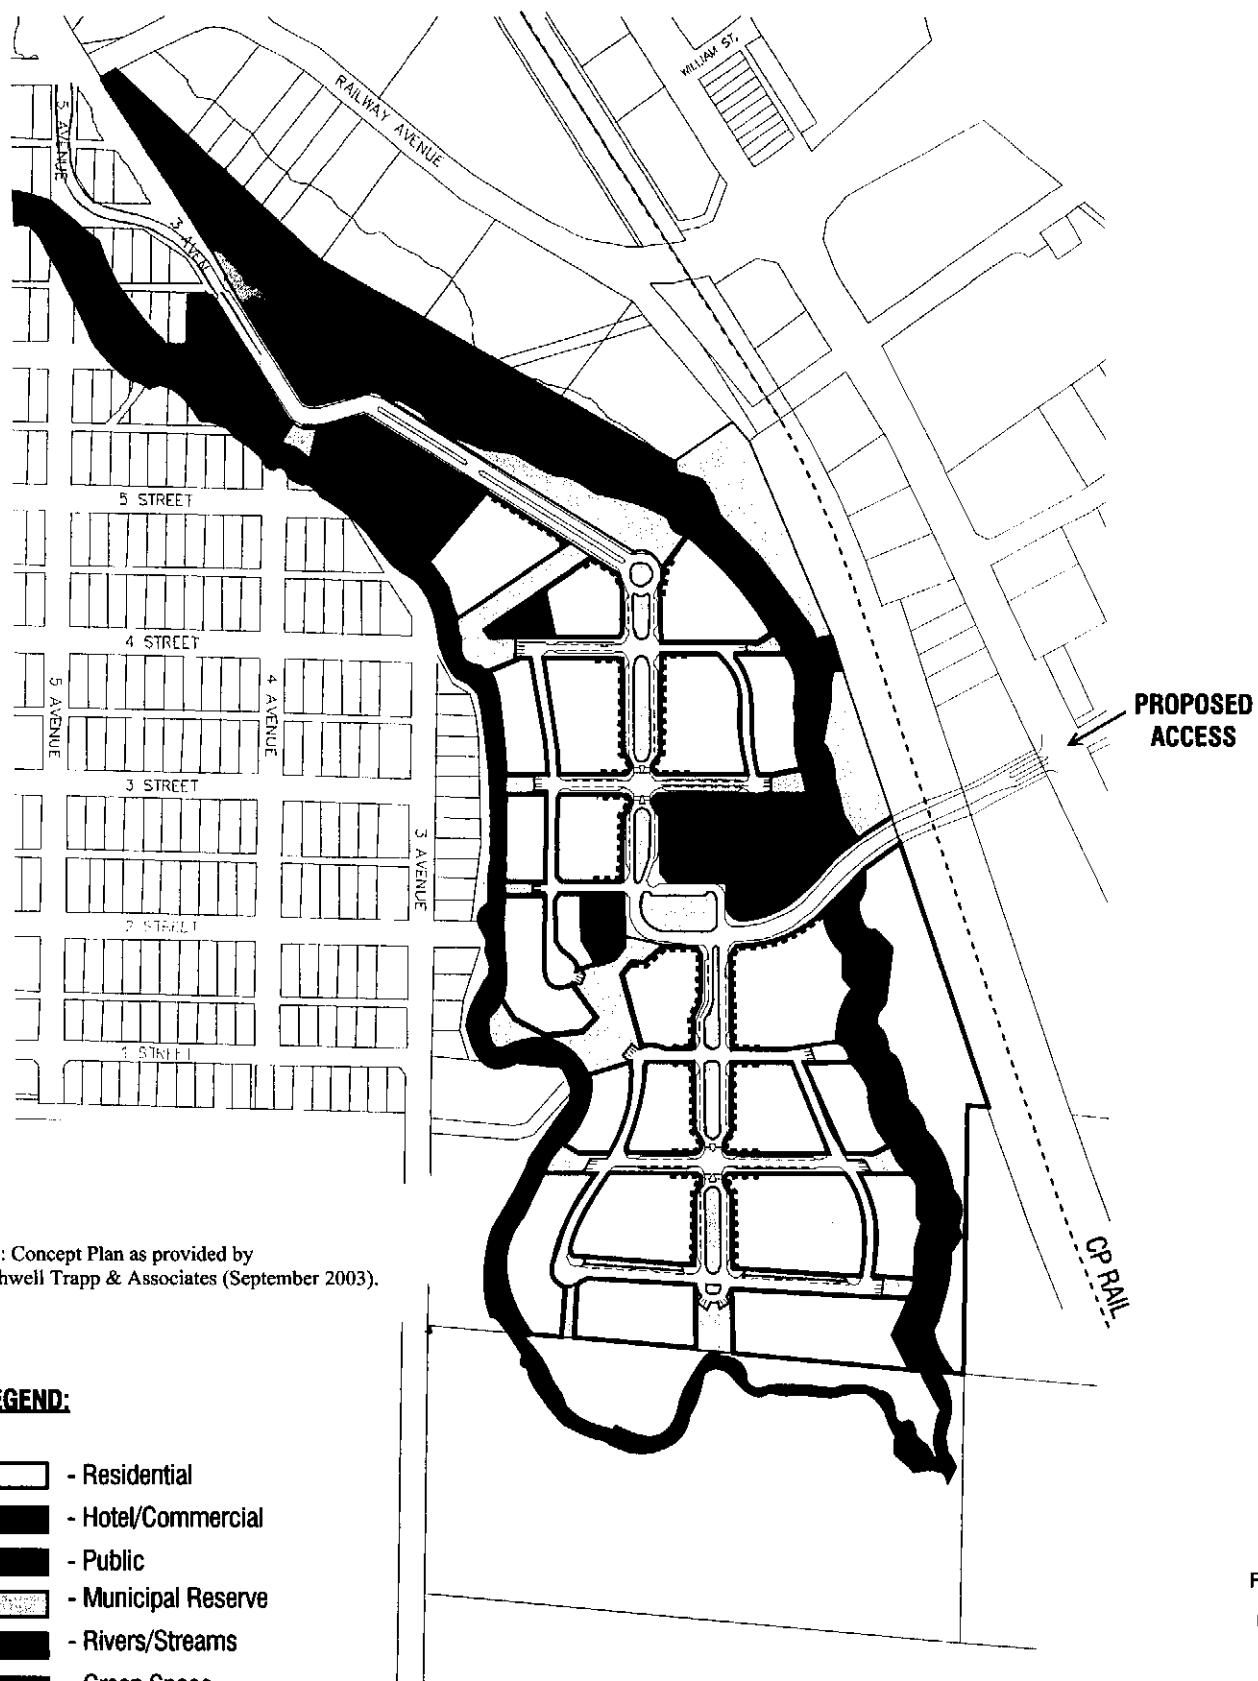

### 4.2 Traffic Generation

In assessing the trip-generating potential of the proposed development, we reviewed published ITE trip generation data, City of Calgary data and FINN previous studies. The widely used publication *Trip Generation*<sup>9</sup> provides a good database of trip generation data (based on studies of existing developments) for a wide variety of uses. The following points summarize our approach to establishing the trip generation of the development areas assessed in the study:

- Traditionally, generalized trip rates of **0.8** (25/75 split) and **1.0** (64/36 split) **vehicle per hour (vph)** **per unit**, during the **weekday** morning and afternoon street peak hours respectively, have been applied to **single-family residential** developments. The **Saturday p.m. peak hour** rate for single-family residential developments was taken at **0.94** (54/46 split) **vph per unit**.
- Similarly, trip rates of **0.56** (25/75 split) and **0.70** (65/35 split) **vph per unit** have been applied to **multi-family residential** developments (apartments/townhomes) during the **a.m. and p.m. street peak hours**. The **Saturday p.m. peak hour** rate for multi-family residential developments was taken as **0.58** (54/46 split) **vph per unit**. These rates are supported by the data presented in the ITE manual.

---

<sup>9</sup> Institute of Transportation Engineers, Trip Generation 6<sup>th</sup> Edition, Washington, D.C.; 1997

Figure

7

**PROPOSED LAND-USE**

- The rates applied to **senior housing** were **0.18** (29/71 split) **vph/unit** in the **weekday a.m. peak hour** and **0.21** (63/37 split) **vph/unit** in the **p.m. peak hour**. The **Saturday p.m. peak hour** trip rate was **0.39** (60/40 split) **vph per unit**. The rates for senior housing were obtained from a study that FINN completed at the Prince-of-Peace Village senior housing near Calgary, AB. This study was completed in May 2003.
- FINN contacted other resort communities to gain information on trip generation rates for non-permanent properties. We were able to obtain information from Aspen, CO and Whistler, BC.. In Aspen, the rate for a single-family unit is used to evaluate non-permanent properties. Whistler evaluates these properties at 80% of the trip generation potential of single-family units. The range of rates for non-permanent properties in Whistler were from 0.45-0.75 and are for the weekend peak hour. We extrapolated this information to obtain a representative rate for the Canmore situation. The proposed non-permanent units are apartment/townhome type and therefore we applied the apartment/townhome trip generation rates at 80%. The non-permanent properties constitute 40% of the total number of proposed apartment units. The trip generation rates for non-permanent properties are therefore **0.45** (25/75 split) **vph/unit** and **0.56** (64/36 split) **vph/unit** in the **weekday a.m. and p.m. peak hours**. The Saturday trip generation rate was **0.46** (54/46 split) **vph/unit**.
- FINN conducted a study of a local hotel, the Sheraton Four Points, to obtain trip generation rates representative of the Canmore specific site. The study was completed in August 2003 for a weekday and Saturday. The resulting trip generation rates were **0.29** (37/63 split) **vph/room** in the **weekday a.m. peak hour** and **0.30** (50/50 split) **vph/room** in the **weekday p.m. peak hour**. The **Saturday** rate was **0.32** (59/41 split) **vph/room**.

The commercial component of the proposed development includes commercial associated with the hotels (restaurants, small shops) and other commercial such as (boutiques, artist studios, specialty shops). The developer indicated that the intended market for the commercial properties would be tourists and local residents. The targeted tourist market would be those who stay at the four hotels within the development. Therefore, the trip generation rates for the commercial development were reduced to account for the high internal draw of these commercial developments.

- The trip generation rate for the commercial is negligible in the weekday a.m. peak hour. The **weekday p.m. peak hour rate** and **Saturday p.m. peak hour rate** was accessed at **2.50** (50/50 split) **vph per 1000 sq. ft** based on the factors mentioned above.

A detailed summary of the resultant peak hour numbers of vehicle trips based on land use is provided in **Table 4**. The values in the tables reflect the use of non-permanent properties to be at 80%. This is representative of occupancy that would occur during a peak period such as the summer or Christmas. The total daily trips generated by the site were calculated from the p.m. peak hour trips multiplied by 11.<sup>10</sup>

#### **4.3 Traffic Distribution and Assignment**

The directional-distribution of the traffic generated by the proposed Spring Creek Mountain Village development was based primarily on information contained in the 2001 Canmore Census <sup>11</sup>. The weekday a.m. and p.m. peak hour distributions were based on employment information and density of residential areas within Canmore obtained from this document. We anticipated that the employment patterns would remain relatively the same in the future and accounted for additional residential growth in the Three Sister's Area to determine the final trip distribution. The Saturday distribution used some of the information utilized for the weekday distribution and adjusted where necessary to take into account locations of attractions in and around Canmore (golf, skiing, shopping). **Figures 8 and 9** outline these distributions. The trips generated by each of the proposed uses were then assigned to the surrounding roadway network and are summarized in **Figures 10 and 11**.

#### 4.4 Internal Roadway Classification

We used the TRANMAP software package to assign the site traffic to the internal and area road networks based on the directional-distribution patterns outlined in Section 4.3. This assignment tool allows us to take into consideration driver's behaviour in selecting the shortest, most logical route between their origin and destination. The resulting estimated weekday daily traffic volumes within the proposed Spring Creek Mountain Village are shown in **Figure 12**.

**Figure 13** shows the recommended internal roadway classification for the Spring Creek Mountain Village. A brief summary of the pertinent Town of Canmore roadway standards based on those roads proposed for the Spring Creek Mountain Village are included in **Table 5**. The developer is proposing three road classes within the proposed Spring Creek Development and these classes are collector, local and mews (private) roads. Table 5 below outlines the corresponding cross-section information.

**TABLE 5. INTERNAL ROADWAY STANDARDS<sup>12</sup>**

TYPE	DAILY TRAFFIC VOLUME (vpd)	NUMBER OF LANES	RIGHT-OF-WAY	PARKING ALLOWED	MINIMUM INTERSECTION SPACING	RESIDENTIAL FRONTRAGE/ DIRECT ACCESS
Collector	1,000 – 12,000	2	21.0 m	Yes	100 m / 220* m	Yes
Local	< 3,000	2	15.0 m	Yes	60 m /100**	Yes
Mews <sup>13</sup>	< 1,500	2	9.0m	No	---	Yes

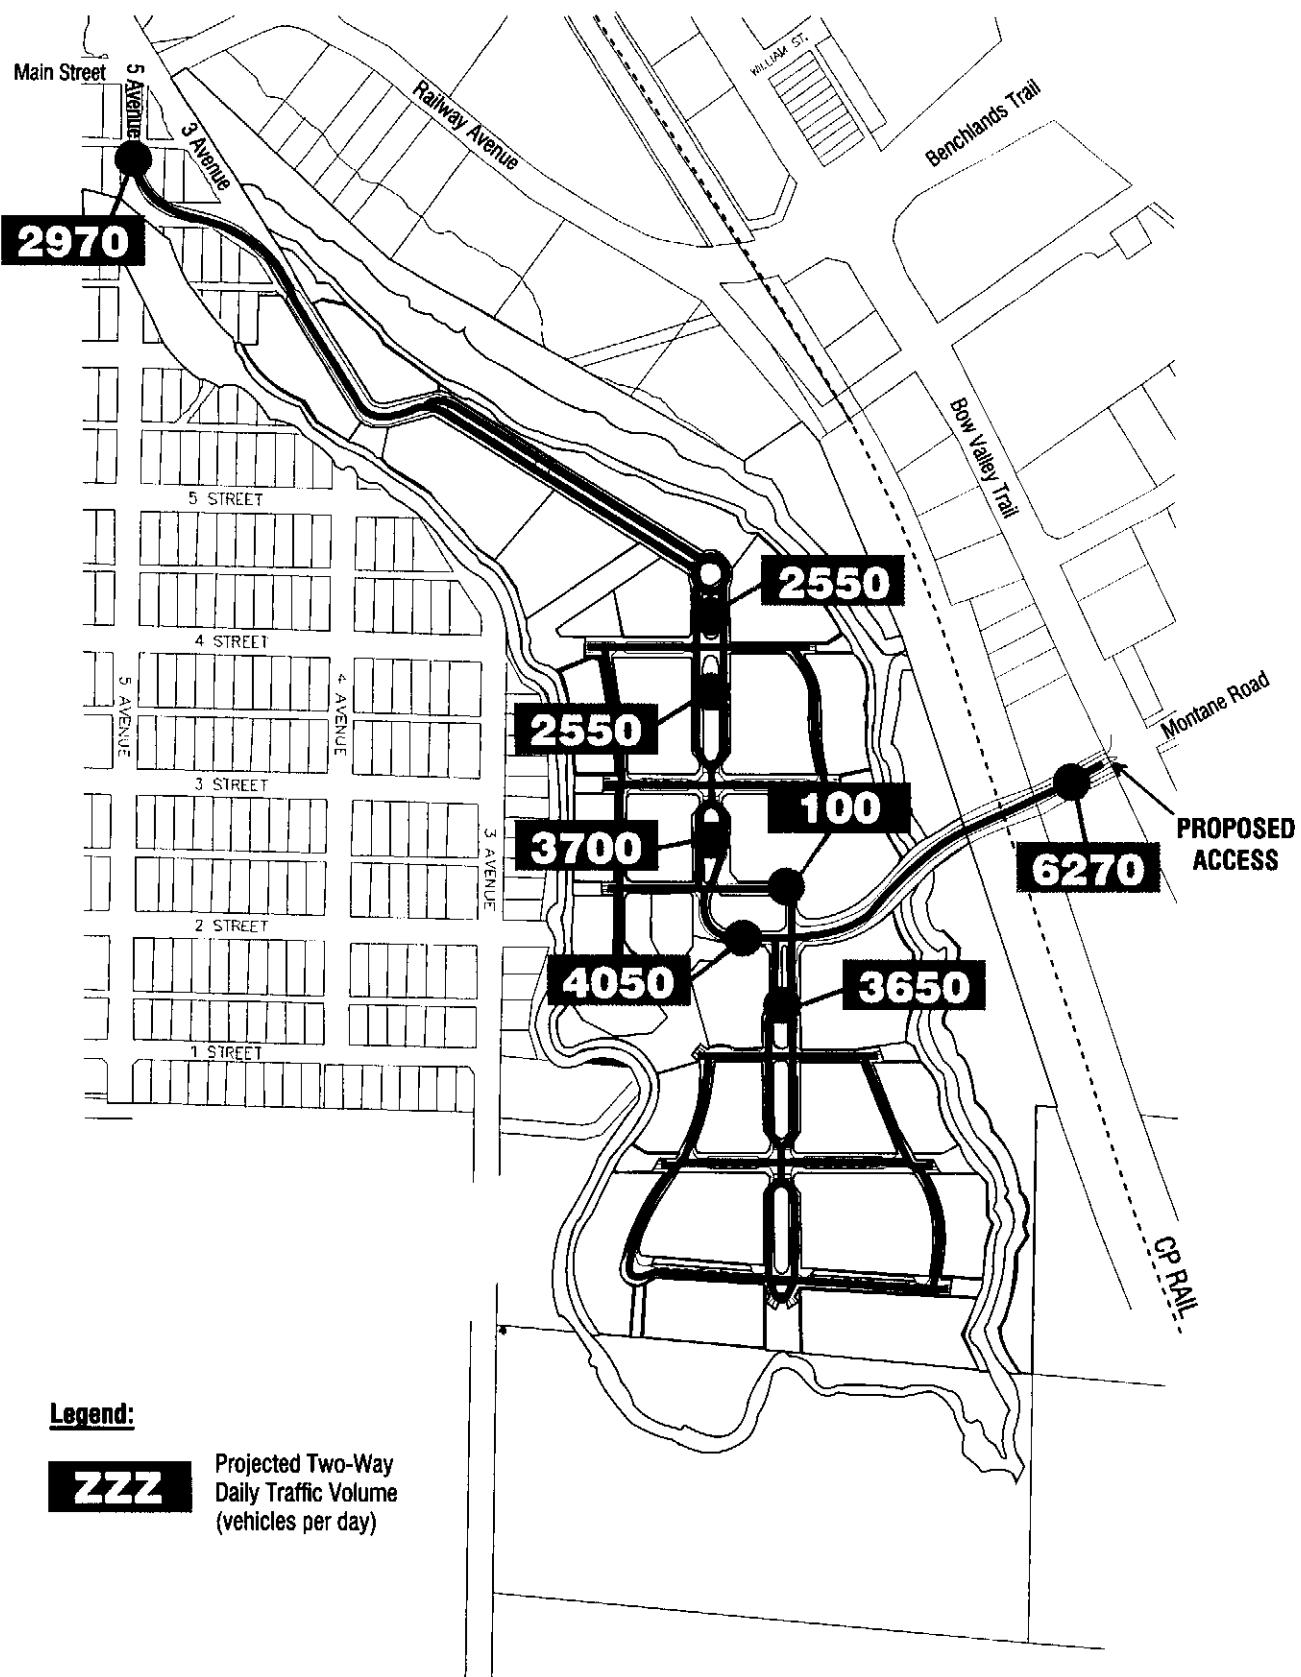

\* Minimum acceptable intersection spacing is 100.0 m between centrelines. If back-to-back left turn bays are required then the minimum spacing shall be 220 m.

\*\* Minimum acceptable intersection spacing is 60.0 m between centrelines (residential). Minimum acceptable intersection spacing is 100.0 m between centrelines (industrial/commercial)

The proposed road network for the Spring Creek Mountain Village is based on the standards stated above and based on these standards should satisfactorily carry the traffic resulting from the proposed development.

## RECOMMENDED INTERNAL ROADWAY CLASSIFICATIONS

File# 5686.02, September 2003

## 5.0 POST-DEVELOPMENT OPERATING CONDITIONS

### 5.1 Post-Development Traffic Volumes

The post-development traffic volumes were obtained by adding the site-generated traffic to the future background traffic volumes. **Figures 14 and 15** outline the post-development traffic volumes.

### 5.2 Post-Development Road Network and Traffic Controls

We assessed the five intersections within the study area assuming the identical lane assumptions and road upgrades assumed in our future background scenario with one exception – the intersection of Bow Valley Trail/Montane Road. In the future background analysis, it was shown that the side-street movements (westbound left-turn) experience long delays. In the future post-development situation, these side-street movements increase from 5% to 30% of the intersection traffic with 25% of this traffic entering and exiting the Spring Creek Mountain Village site. We carried out a traffic signal warrant analysis for this intersection and determined that it still did not meet the warrants (45/100 during the weekday p.m. peak hour and 32/100 during the Saturday peak hour (**Appendix C**)). However, without a traffic signal the side-street movements, especially the eastbound left-turn, would experience significant delays and queuing. **Table 6** demonstrates the calculated lane LoS, delay and queue length for the critical movements – westbound left-turn and eastbound-left-turn. As expected, these movements experience poor LoS, long delays and long queue lengths without a signal at this location. In fact, the eastbound left-turn queues would back up well past the Canadian Pacific Railway line and could thus interfere with railway operations and/or present a potential safety concern. Therefore, in order to better facilitate these movements we recommend a traffic signal for the intersection and have assumed such in the analysis presented herein.

**TABLE 6. OPERATING CONDITIONS OF PROPOSED ACCESS (UNSIGNALIZED)**

### 5.3 Post-Development Operating Conditions

We assessed the future post-development peak hour operating conditions at the five intersections within the study area. The results are summarized in Table 7.

**TABLE 7. FUTURE POST-DEVELOPMENT OPERATING CONDITIONS**

INTERSECTION	PEAK HOUR	OVERALL INTERSECTION LOS	AVERAGE DELAY (secs/veh)	V/C RATIOS ABOVE 0.90 THRESHOLD
<b>Main St/6 Ave (signalized)</b>	AM	A	6	--
	PM	B	11	--
	SAT	A	7	--
<b>Main St/5 Ave (unsignalized)</b>	AM	A	3	n.a.
	PM	A	5	n.a.
	SAT	A	3	n.a.
<b>Main St/Railway Ave (signalized)</b>	AM	B	19	--
	PM	D	42	EBL=0.98; SBT=0.96; NBL=0.94; NBT=0.93
	SAT	C	26	--
<b>Bow Valley Tr/Benchlands Tr (signalized)</b>	AM	C	22	--
	PM	C	26	--
	SAT	C	35	--
<b>Bow Valley Tr/Montane Rd (signalized)</b>	AM	A	9	--
	PM	A	10	--
	SAT	B	14	--

The results summarized in Table 7 indicate the following:

- **Main Street/6 Avenue, Bow Valley Trail/Benchlands Trail and Bow Valley Trail/Montane Road** are expected to operate at acceptable overall Levels-of-Service during the weekday a.m. and p.m. peak hour and Saturday peak hour. At the intersection of Bow Valley Trail/Montane Road, for the eastbound left-turn movement the queue length is 34 m in the weekday p.m. peak hour and 31 m in the Saturday p.m. peak hour. The

queue length for the westbound left-turn movement at this intersection is 5 m for the weekday p.m. peak hour and 15 m in the Saturday p.m. peak hour.

- **Main Street/5 Avenue** will operate at acceptable overall Levels-of-Service with the site traffic during the a.m., p.m. and Saturday peak hours. If we assumed that the traffic signals along Main Street continued to not be coordinated with each other we expect the northbound left-turn movement to operate at LoS F during the p.m. peak hour. However, this delay can be reduced to acceptable levels by simply coordinating the traffic signals along Main Street in order to provide good two-way traffic progression along the corridor. Once the resulting platoons of vehicles have passed 5 Avenue, the outbound traffic will be provided with better opportunities for completing the northbound left-turn.
- **Main Street/Railway Avenue** will operate at acceptable overall Levels-of-Service during the weekday a.m. and Saturday p.m. peak hours. For the weekday p.m. peak hour the eastbound left-turn, southbound through, northbound left and northbound through are expected to operate with V/Cs greater than the 0.9 threshold. It should be noted that of this traffic, for these critical movements, Spring Creek Mountain Village consists of 14% of the eastbound left-turn movement traffic and less than 5% of the southbound through, northbound left-turn and through movement traffic.

## 6.0 INTERSECTION OF BOW VALLEY TRAIL / SITE ACCESS

### 6.1 Preliminary Design

A preliminary design for the proposed intersection of Bow Valley Trail/Site Access was prepared by FINN and is shown in **Figure 16**. This design was developed prior to starting the TIS for the Spring Creek Mountain Village and was based on the current collector standard roadway guidelines for the City of Calgary.

### 6.2 Access Requirements to Parcel A and B

The proposed intersection will divide the existing land west of Bow Valley Trail into two Parcels – A and B (see Figure 16). The current landowner, from which the new intersection ROW will be taken, in negotiations with the developer has requested that the two resulting land parcels have access off the proposed access road and Bow Valley Trail. Therefore, access would be required at four separate locations.

### 6.3 Access Requirements – Design Guidelines

The Transportation Association of Canada (TAC) has developed a document entitled the Geometric Design Guide for Canadian Roads (GDGCR). Chapter 3.2<sup>14</sup> provides guidelines with respect to access management for a full range of road classifications, from freeways to local rural and urban roads.

We note that there is approximately 100m from the proposed centreline of Bow Valley Trail (at the proposed intersection) to the railway tracks located west of the intersection. Section 2.3.13 in the GDGCR details the requirements for railway grade crossings including distance from the nearest intersection or access to the railway crossing. Based on these requirements the minimum distance from the travelled way of the intersecting road or entrance way shall not be closer than 30m to any part of the grade crossing surface, where train speeds exceed 25 km/h<sup>15</sup>. If an access was placed 30m from the railway crossing for both Parcel A and B, along

---

<sup>14</sup> Transportation Association of Canada, **Geometric Design Guide for Canadian Roads**, Ottawa, Canada, September 1999

<sup>15</sup> Transportation Association of Canada, **Geometric Design Guide for Canadian Roads**, Ottawa, Canada, September 1999, Pg. 2.3.13.1

the proposed road, then the access would be about 70m from Bow Valley Trail. In Calgary, 60m is used for all-turns intersection spacing on collector roadways. Therefore, at this time, from a geometric perspective, it seems feasible to have two accesses off of the proposed collector road – one to Parcel A and B. However, the design of these accesses would have to be further verified through discussions with CPR and operational analyses of proposed developments on these land Parcels.

Direct all-turns access to the two Parcels from Bow Valley Trail is feasible however operational analyses of the proposed developments on Parcels A and B will be required to determine the impact of the traffic. We note that the provision of all-turns access from Bow Valley Trail and the proposed collector road allows for better traffic circulation.

#### III Crossing Gaps, Intersecting Volumes, and Pedestrian Volumes

##### A. Through Street One-Way (Figures B2-4 and B2-5)

###### 1). Priority points

$$= (V_{aew} + P_{ew}) \times (V_{ans} + P_{ns}) \times F_{ow} \times F_t$$

$$= (\underline{\hspace{1cm}} + \underline{\hspace{1cm}}) \times (\underline{\hspace{1cm}} + \underline{\hspace{1cm}}) \times \underline{\hspace{1cm}} \times \underline{\hspace{1cm}} = \underline{\hspace{1cm}}$$

###### 2). Priority points

$$= P_3 \times F_t = \underline{\hspace{1cm}}$$

##### B. Through Street Two-Way

###### Priority points

$$= (V_{aew} + P_{ew}) \times (V_{ans} + P_{ns}) \times F_{ow}$$

$$= (\underline{\hspace{1cm}} + \underline{\hspace{1cm}}) \times (\underline{\hspace{1cm}} + \underline{\hspace{1cm}}) \times \underline{\hspace{1cm}} = \underline{\hspace{1cm}} 88.21$$

### TOTAL PRIORITY POINTS

31.77

NOTE: Complete I; the appropriate equation for each intersection leg in Section II A and/or II B; and either Section IIIA or IIIB.

\* Maximum points for II = + 80

FIGURE B2-6

Assumptions:

1. Distance from nearest signal = 450m.
2. Nearest signal cycle length = 100 sec.
3. Speed = 60 km/h
